Taules de probabilitat

Funció de probabilitat acumulada binomial

La següent taula correspon a la distribució de probabilitat acumulada $F_X(k) = P(X \le k)$ d'una variable aleatòria X que segueix una distribució binomial amb n repeticions i probabilitat d' èxit p. Per exemple si tenim una binomial amb n = 5 i p = 0, 2 llavors $F_X(2) = 0,9421$, si a més volem calcular la funció de probabilitat podem fer $f_X(2) = P(X = 2) = F_X(2) - F_X(1) = 0,9421 - 0,7373 = 0,2048$.

Propietat. Si Y és una B(n, p) llavors X = n - Y és una B(n, q) amb q = 1 - p.

Utilitzant aquesta propietat podem calcular les probabilitats de binomials per a les quals la probabilitat d'èxit no es troba a la taula. En concret, si Y és una binomial amb n repeticions i amb probabilitat d'èxit p > 0.5 i volem calcular la funció de probabilitat acumulada llavors $P(Y \le k) = 1 - P(X \le (n - k) - 1)$ és a dir $F_Y(k) = 1 - F_X(n - k - 1)$. Per exemple si Y és una v.a. binomial amb n = 4 i p = 0, 9 i X és una v.a. binomial amb n = 4 i p = 1 - 0, 9 = 0, 1 llavors $F_Y(3) = P(Y \le 3) = 1 - P(X \le 4 - 3 - 1) = 1 - F_X(0) = 1 - 0,6561 = 0,3439$.

Per a la funció de probabilitat podem utilitzar la següent fòrmula P(Y=k)=P(X=n-k) on X és una binomial amb probabilitat d'èxit 1-p. Per exemple si volem calcular P(Y=3) per a una binomial n=4 i p=0,9 llavors $P(Y=3)=P(X=1)=F_X(1)-F_X(0)=0,9477-0,6561=0,2916$ mirant la taula de la binomial amb n=4 i p=0,1. El que fem en qualsevol cas és canviar els èxits pels fracassos.

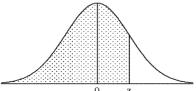

Funció de probabilitat acumulada Poisson

La següent taula correspon a la funció de distribució acumulada $F_X(x) = P(X \le x)$ d'una variable aleatòria X amb distribució Poisson i $E(X) = \lambda$. Per exemple si $\lambda = 0, 1$ $F_X(1) = P(X \le 1) = 0,9953$ i $f_X(1) = P(X = 1) = F_X(1) - F_X(0) = 0,9953 - 0,9048 = 0,0905$.

Funció de probabilitat acumulada Normal estàndard

Aquesta taula calcula $F_Z(z)=P(Z\leq z)$ per a una variable Z normal estàndard (és a dir $\mu_Z=0$ i $\sigma_Z=1$). Per exemple $F_Z(1,78)=0,9625$.

Si volem calcular $F_Z(-z)$ per a z>0 utilitzam la següent propietat de la distribució normal $F_Z(-z)=1-F_Z(z)$. Per exemple $F_Z(-1)=1-F_Z(1)=1-0.8413=0,1587$. Si X segueix una distribució normal amb mitjana μ_X i desviació típica σ_X llavors $F_X(x)=P(X\leq x)=P(\frac{X-\mu_X}{\sigma_X}\leq \frac{x-\mu_X}{\sigma_X})=P(Z\leq \frac{x-\mu_X}{\sigma_X})=F_Z(\frac{x-\mu_X}{\sigma_X})$. Per exemple si X segueix una distribució normal amb mitjana $\mu_X=10$ i desviació típica $\sigma_X=2$ llavors $F_X(11)=F_Z(\frac{11-10}{2})=F_Z(0,5)=0,6915$.
